

# Application of Abstract Data Types (ADT) and Stack in Student Management

Phạm Hiếu Trung

# Abstract Data Types (ADT)

- Definition: ADTs represent how data is defined and the operations allowed on that data, without worrying about the implementation.
- Example: Stack, Queue, List are examples of ADTs.
- Key Principle: Abstraction, hiding the internal details of data representation.

# **ADVANTAGES OF ADTS**

- **Separation of concerns: Data and operations are separated from implementation.**
- **Modularity: Easy to modify and extend.**
- **Reusability: ADTs can be reused across different applications.**

# Stack - Definition and Characteristics

- Definition: A Stack is an ADT that follows the Last In, First Out (LIFO) principle.

Operations:

Push: Add an element to the top.

Pop: Remove an element from the top.

Peek: View the top element without removing it.

# Use Cases of Stack in Software Development

- **Memory management:** Stack is used to manage function calls (call stack).
- **Undo operations:** Used in text editors and other software to keep track of actions.
- **Expression evaluation:** Used in arithmetic and logical expression parsing.

# Problem Breakdown

Input: Student ID, Name, Score.

Process: Add, edit, delete, and  
manage students in a stack.

Output: Display student information  
and ranking.

# How the Stack Solves the Problem

- Stack Operations: Each action (Add, Edit, Delete) can be represented as a stack operation.

- LIFO Logic: The most recently added student is the first to be processed.

- Data Security: Helps in managing memory efficiently, reducing overhead.

# Code Walkthrough - Part 2: Stack Implementation

Stack Class: Implements the basic operations of a stack.

Operations:

push: Adds a student to the stack.

pop: Removes the top student.

peek: Views the top student without removing.

isEmpty: Checks if the stack is empty.

# Code Walkthrough - Part 3: Node Class

- Node Structure:** Each Node holds a reference to a Student object and the next node in the stack.
- Linked List:** Stack is implemented using a linked list of nodes.

# **Code Walkthrough - Part 4: Main Program**

**Initialize Stack: Create a new stack of students.**

**Sample Operations: Add students, display the stack, pop students, and test stack functionality.**

**Demo: Running the program to show stack operations.**

# Stack Operations in the Student Management System

**Adding a student: Using the push operation.**

**Removing a student: Using the pop operation.**

**Peeking at the last student added: Using the peek operation.**

# Ranking System Based on Student Score

- Score Ranges: [0 – 5.0)
  - Fail [5.0 – 6.5)
  - Average [6.5 – 7.5)
  - Good [7.5 – 9.0)
  - Very Good [9.0 – 10.0]
- Excellent Assign Ranking: Based on the student's score, the program assigns a rank.

An illustration of a desk setup on a dark blue background. It includes a laptop with a teal screen and keyboard, a stack of three books in teal, orange, and white, a potted plant with green leaves in a pink pot, a teal pen holder with three pens, and a small window or tablet showing a pink and teal interface.

## EXAMPLE OF RANKING LOGIC

- **Student Data:**
- ID: 1, Name: Hưng, Score: 7.2 (Rank: Good)
- ID: 2, Name: Trung , Score: 9.1 (Rank: Excellent)
- **Ranking Output:** Displays rank based on the predefined ranges.

## ADDING EDIT AND DELETE OPERATIONS

- **Edit:** Modify student details (ID, name, or score).
- **Delete:** Remove a student from the stack using

```
public Student pop() { no usages
    if (isEmpty()) {
        System.out.println("Stack Underflow! No students to remove.");
        return null;
    }
    Student poppedStudent = top.student;
    top = top.next;
    size--;
    return poppedStudent;
}
```

A stylized illustration of a desk setup. In the center is an open laptop with a teal screen and a dark keyboard. To the left of the laptop is a stack of three books in teal, orange, and teal. Below the books is a potted plant with long, pointed leaves in teal and orange, sitting in a light orange pot. To the right of the laptop is a teal pen holder with a pink patterned base, containing three pens in orange, teal, and orange. Above the laptop is a map or document with a teal background, orange lines, and a grid of small white dots. In the bottom right corner, there is a small illustration of a computer monitor with a pink screen and teal window frames.

## SORTING AND SEARCHING STUDENTS

**Sorting:** Implement a sorting algorithm (e.g., Bubble Sort) to order students by score.

**Searching:** Linear search through the stack to find students by ID or name.

A stylized illustration of a desk setup. In the center is an open laptop with a teal screen and a pink keyboard. To the left of the laptop is a stack of three books in teal, orange, and teal. Below the books is a potted plant with long, pointed leaves in teal and orange, sitting in a pink pot. To the right of the laptop is a teal pen holder with a pink base, containing three pens in teal, orange, and teal. Above the laptop is a teal folder or notebook with a pink cover and a teal pattern. The background is a solid dark blue.

## ALTERNATIVE ALGORITHM PROPOSAL

- **Bubble Sort:** Sort students by score.
- **Alternative:** Use Quick Sort or Merge Sort for better efficiency with large datasets.
- **Evaluation:** Comparing time complexity and efficiency.

A stylized illustration of a desk setup. In the center is a laptop with a teal screen and a pink keyboard. To the left of the laptop is a stack of three books in teal, orange, and teal. Below the books is a potted plant with long, pointed leaves in teal and orange, sitting in a pink pot. To the right of the laptop is a teal pen holder with a pink base, containing three pens in teal, orange, and teal. Above the laptop is a teal folder or notebook with a pink cover and a teal patterned interior. In the bottom right corner, there is a small illustration of a computer monitor with a pink screen and teal windows.

## ADVANTAGES OF USING STACK

- **Efficiency:** Simple implementation, constant- time complexity for push and pop operations.
- **Memory management:** Effective for managing data in a LIFO structure.
- **Flexibility:** Can be adapted to various use cases like undo functions, recursion management, etc.

To the right of the laptop is a teal pen holder with a pink patterned base, containing three pens in orange, teal, and orange. Above the laptop is a map or document with a teal background and orange lines. In the bottom right corner, there is a small illustration of a computer monitor displaying a pink and teal interface.

## PROGRAM EXECUTION DEMONSTRATION

- **Adding Students:** Running the program to add students to the stack.
- **Viewing Students:** Demonstrating the push and display functionality.

# Program Improvement Suggestions (Part 1)

Code Optimization: Consider using a different data structure, such as a queue.

Security: Add authentication systems to protect student management.

# Program Improvement Suggestions (Part 2)

- User Interface: Introduce a graphical user interface (GUI) for easier student management.
- Testing: Include unit tests to verify program reliability and functionality.

# Applications of ADT and Stack in Other Fields

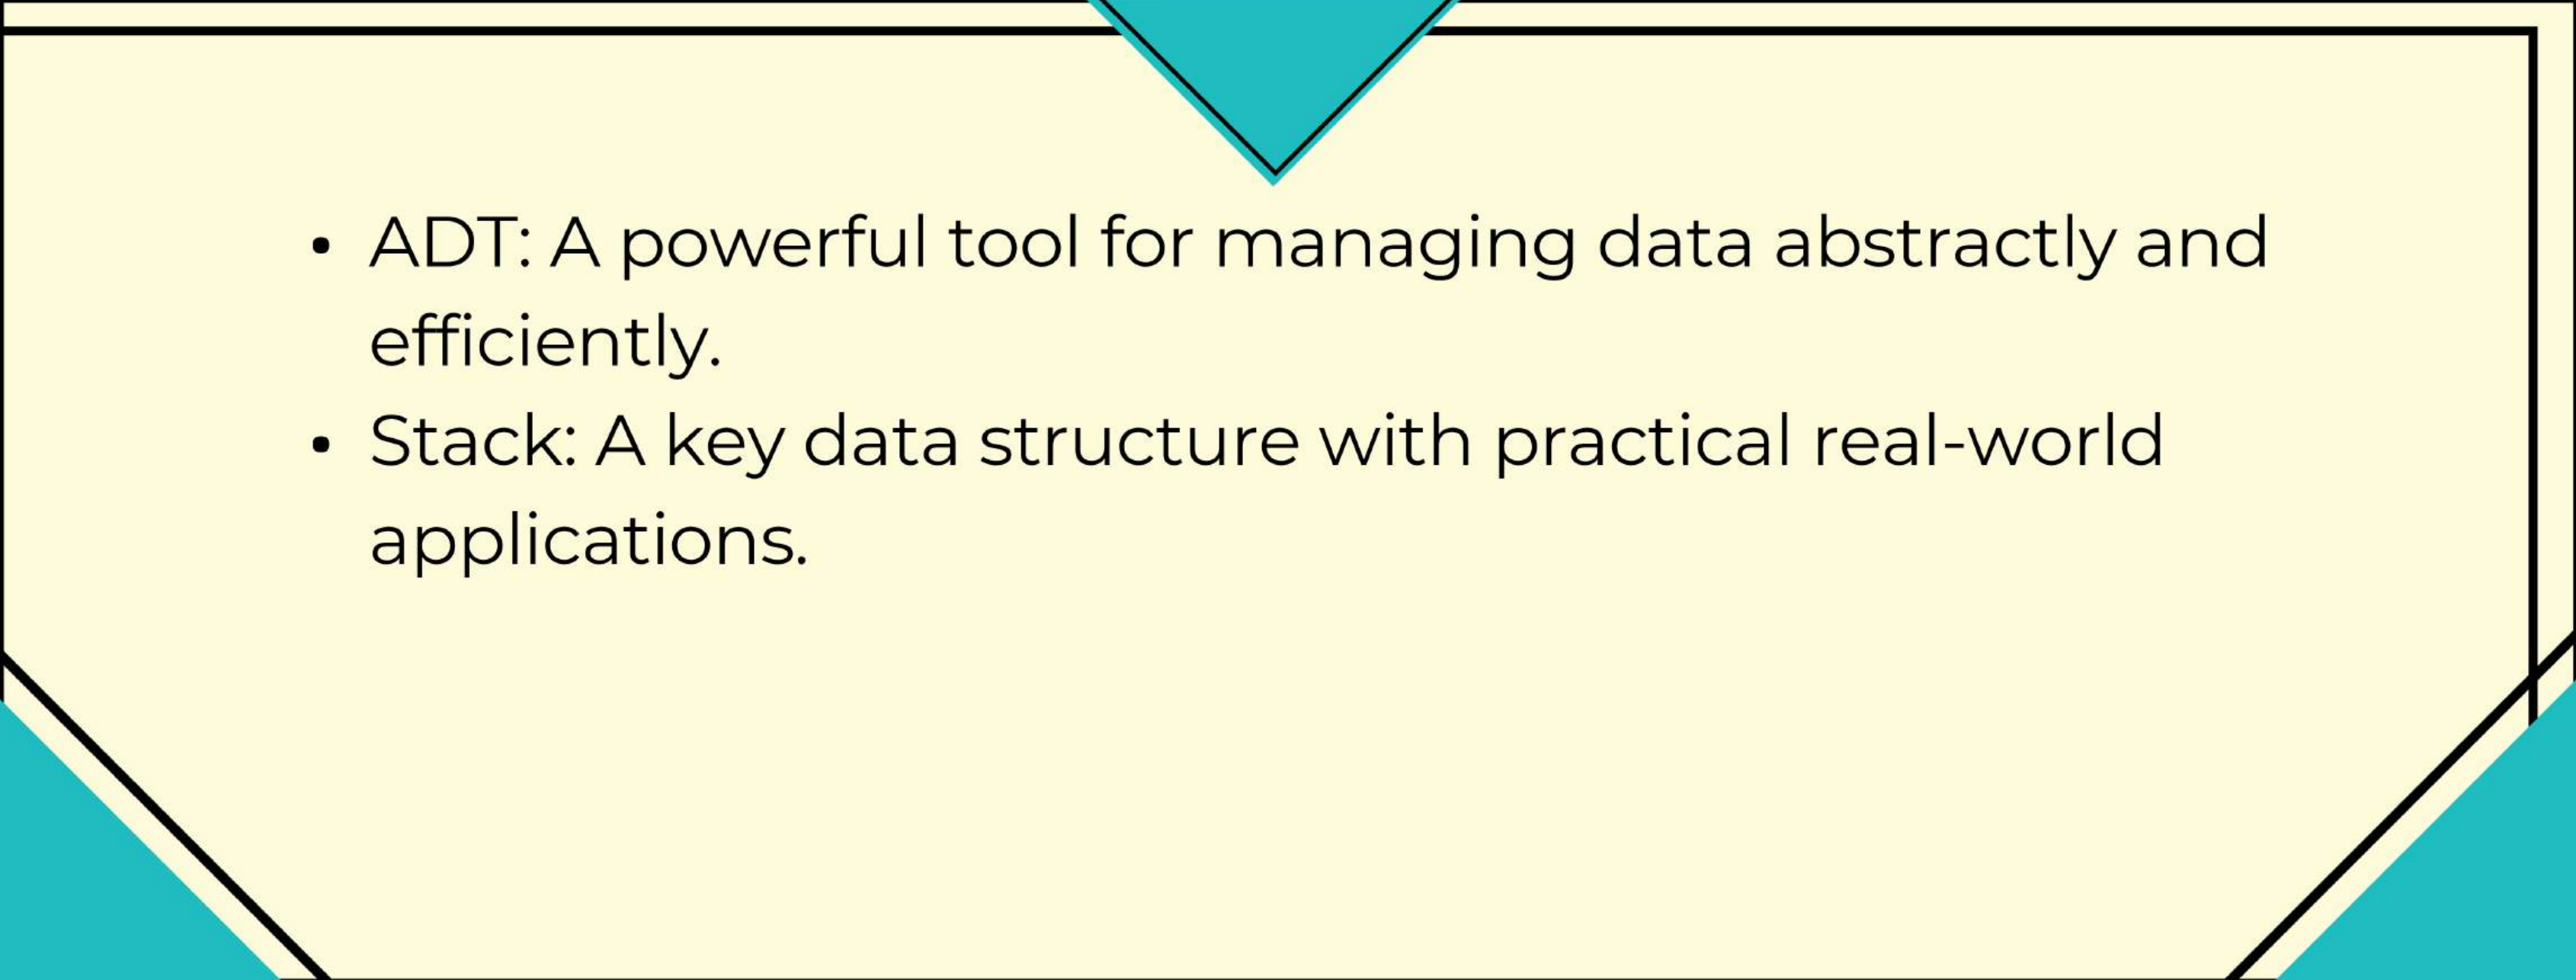

- Game Development: Using stack for move history and undo functionality.
- Computer Science: Stack is essential for algorithms and memory management.

# Optimizing Stack for Large Applications

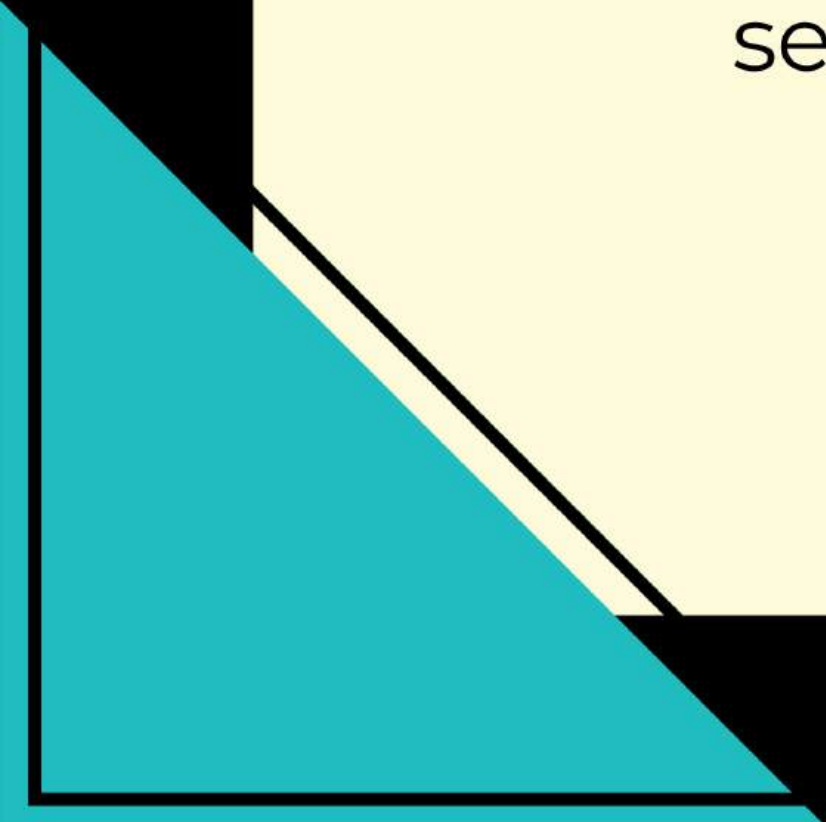

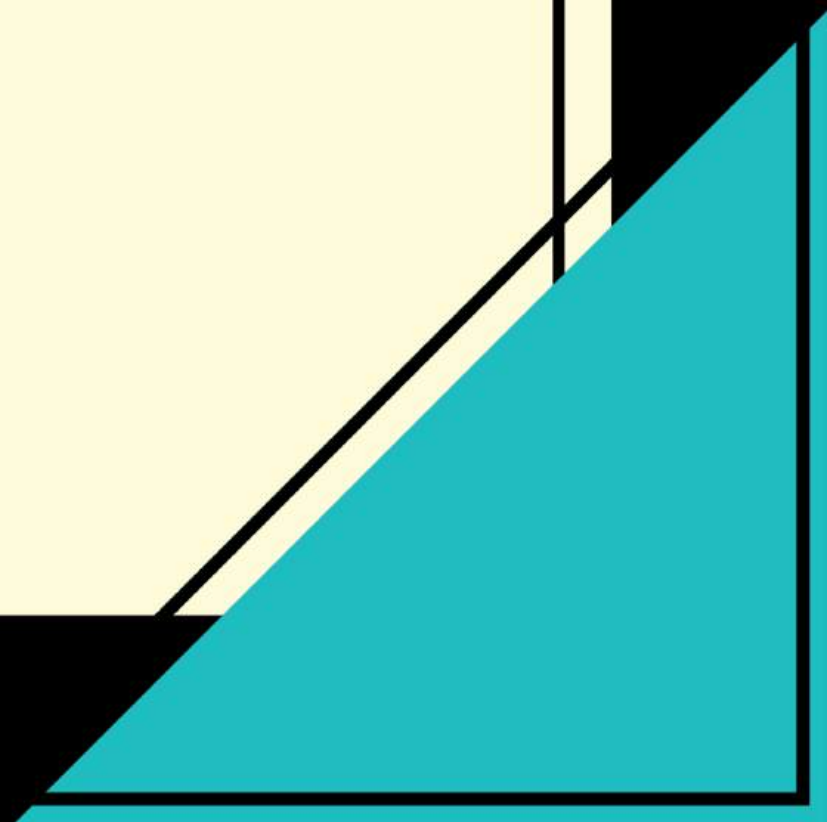

- Memory Optimization: Use efficient data structures for large-scale applications.
- Algorithm Improvement: Implement more optimized algorithms for student management.

# Summary of ADT and Stack

- 
- ADT: A powerful tool for managing data abstractly and efficiently.
  - Stack: A key data structure with practical real-world applications.

# Pros and Cons of Stack

- 
- Pros: Simple, easy to implement, and effective for LIFO operations.
  - Cons: Limited by the LIFO structure, harder to handle non-sequential data.
- 
- 

# Comparing ADT with Other Data Structures

- ADT: Focuses on operations without worrying about implementation details.
- Comparison: Arrays (fixed size) vs Linked Lists (dynamic size).
- Example: ADT hides data representation, while data structures focus on implementation.

THANK YOU
